PNA encoding v28 seven transmembrane receptor polypeptide - useful for producing recombinant polypeptide and anti-V28 antibodies, and in screening assays for v28 agonists and antagonists.

Claim 1: Columns 61-64: 56pp; English.

The present sequence claimed by the invention represents the human v28 years transmembrane (7TM) receptor. It is encoded by the full length v28 genomic DNA (V18343) or by the v28 CNA (V18352). As the v28 protein (W48722) is a 7TM receptor it is probably involved in signal transduction. The invention also claims that cells transformed with v28 DNA can be used to produce the recombinant polypeptide, to produce anti-v28 antibodies or in screening assays for v28 agonists or antagonists. The antibodies, agonists and antagonists could then be used to modulate v28 receptor-ligand binding, for e.g. in immunological and/or inflammatory events in vivo.
                                                                                                                                                                     W48722
                                                                                                                                                                                                                                                                                                                                                                          17-NOV-1993; 153848.

New method for increasing production of 1,3-propane:diol - comprises fermentation of inexpensive carbon sources by microorganism expressing dehydratase, used, e.g. to prolong half-life of enzyme bisclosure; Page 70-71; 133pp; English.

The sequence is that of glycerol-3-phosphate dehydrogenase. It was used as part of a method of fermentative production of 1,3-propanediol (1,3-pd), using an organism comprising at least 1 gene encoding a dehydratase, is improved by inserting into the host a gene encoding protein x and culturing the transformant in presence of a carbon source (e.g. mono-, oligo-organism starting material for polyssters, polyurethanes and cyclic compounds. 1,3-pd can now be produced by a single recombinant organism from inexpensive carbon sources such as glucose (rather than costly glycerol or dihydroxyacetone), rapidly and without causing pollution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     W54728 Length: 24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     residue(s) to antigen for increasing T cell response, useful in, e.g. vaccines against viral infection(s)

Disclosure; Page 34; 47pp; English.

The peptides W54559-W54609 are examples of peptides to which at least 1 (preferably 2) mannose can be attached to increase their uptake as antigens by antigen-presenting cells. Uptake of agonist mannosylated peptides will increase the T cell response, whereas uptake of antagonist peptides will increase the T cell response. Blocking binding of immunogenic autoantigens can be used in treatment of type I diabetes, rheumatoid arthritis, graft rejection etc., also to induce T-cell non-responsiveness. Vaccines containing mannosylated antigen are used to prevent or treat infections by, e.g. bacteria, viruses, fungi, helminths

PT Introducing genes into eukaryotic cells using peptide with two processors are specially as part of a viral glyco-protein, used in gene therapy to ensure precise targeting of PT glyco-protein, used in gene therapy to ensure precise targeting of PT vectors to particular cell types

PS Disclosure; Fig 36; 117pp; French.

CC A novel chimeric protein for gene transfer comprises, at the N-terminus, CC a protein binding a target molecule on the cell surface, and, at the CC terminus, a second protein recognising a secondary target molecule on the cell surface. The two domains are separated by a peptide comprising CC folds (beta or reverse turns) in the peptide sequence, the folds being CC regularly spread to form a polyproline beta-turn helix structure. This CC sequence is an example of a Pro-rich linking peptide. The pro-rich CC peptide acts by facilitating or inhibiting binding between the C-terminal CC protein does not interact with its target. The whole construct especially forms part of a (retro)viral envelope glycoprotein. The recombinant CC (retro)viral particles are used for in vitro or ax vivo transfer of CC nucleic acid into target cells, especially for gene therapy, e.g. in CC cystic fibrosis, myopathy, lysosomal disorders, cancer, viral (especially SC) Sequence 39 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "polyproline beta-turn helix" polypeptide Delta-PRO4-int.

Introducing genes into eukaryotic cells using peptide with two receptor binding regions - especially as part of a viral glyco-protein, used in gene therapy to ensure precise targeting of vectors to particular cell types pisclosure; Fig 37; 117pp; French.

A novel chimeric protein for gene transfer comprises, at the N-terminus, a protein binding a target molecule on the cell surface, and, at the C-terminus, a second protein recognising a secondary target molecule on the cell surface. The two domains are separated by a peptide comprising at least 30% pro residues arranged so as to induce approximately 180 deg. Folds (beta or reverse turns) in the peptide sequence, the folds being regularly spread to form a polyproline beta-turn helix structure. This sequence is an example of a Pro-rich linking peptide. The pro-rich peptide acts by facilitating or inhibition occurs as long as the N-terminal protein and its receptor, and inhibition occurs as long as the N-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   myopathy; lyso

              Introducing genes into eukaryotic cells using peptide with two proceeding genes into eukaryotic cells using peptide with two proceeding genes into eukaryotic cells using peptide with two proceeding genes in gene therapy to ensure precise targeting of proceeding in gene therapy to ensure precise targeting of proceding at gene transfer comprises, at the N-terminus, considered binding a target molecule on the cell surface, and, at the cell surface in the two domains are separated by a peptide comprising a target molecule on the cell surface. The two domains are separated by a peptide comprising cell teast 30% pro residues arranged so as to induce approximately 180 deg. Celds (beta or reverse turns) in the peptide sequence, the folds being regularly spread to form a polyproline beta-turn helix structure. This cell sequence is an example of a pro-rich linking peptide. The pro-rich cell sequence is an example of a pro-rich linking between the C-terminal protein does not interact with its target. The whole construct especially forms part of a (retro)viral envelope glycoprotein. The recombinant cell fibrosis, myopathy, lysosomal disorders, cancer, viral (especially sequence 127 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     W44906 Length: 70 February 11,

The whole construct espect forms part of a (retro)viral envelope glycoprotein. The recombinant (retro)viral particles are used for in vitro or ex vivo transfer of nucleic acid into target cells, especially for gene therapy, e.g. in cystic fibrosis, myopathy, lysosomal disorders, cancer, viral (especialman immunodeficiency virus) infections, etc. Sequence 70 AA;

receptor binding regions - especially as part of a viral plyco-protein, used in gene therapy to ensure precise targeting of provectors to particular cell types

Provectors to particular cell types

Provectors to particular cell types

Prove the chimeric protein for gene transfer comprises, at the N-terminus, a condition a target molecule on the cell surface, and, at the cerminus, a second protein recognising a secondary target molecule on the cell surface, and, at the cell surface. The two domains are separated by a peptide comprising the cell surface arranged so as to induce approximately 180 deg. CC at least 30% pro residues arranged so as to induce approximately 180 deg. CC regularly spread to form a polyproline beta-turn helix structure. This ceguence is an example of a pro-rich linking peptide. The pro-rich comprising peptide acts by facilitating or inhibiting binding between the C-terminal protein and its receptor, and inhibition occurs as long as the N-terminal composition of a (retro)viral envelope glycoprotein. The recombinant composition part of a (retro)viral envelope glycoprotein. The recombinant composite acid into target cells, especially for gene therapy, e.g. in cucleic acid into target cells, especially for gene therapy, e.g. in composite the content of composition of the composition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              pr Introducing genes into eukaryotic cells using peptide with two process process, and process are specially as part of a viral process process, used in gene therapy to ensure precise targeting of process to particular cell types.

Process to particular cell types

Process to the cell surface, and the N-terminus, and the cell surface and the cell surface, and the cell surface and the cell surface, and the cell surface are separated by a peptide comprising cell the cell surface. The two domains are separated by a peptide comprising cell surface. The two domains are separated by a peptide comprising cell seast 30% processed the process to induce approximately 180 deg. Cell the two the cell surface, the folds being cell surface to form a polyproline beta-turn helix structure. This cell sequence is an example of a pro-rich linking peptide. The pro-rich cell sequence is an example of a pro-rich linking peptide. The pro-rich cell peptide acts by facilitating or inhibiting binding between the C-terminal cell protein does not interact with its target. The whole construct especially forms part of a (retro)viral envelope glycoprotein. The recombinant cell construct and into target cells, especially for gene therapy, e.g. in custoff brossis, myopathy, lysosomal disorders, cancer, viral (especially construct construct cells) into the first cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             W44908 Length:

"polyproline beta-turn helix" polypeptide PRO+(4070A).
"polyproline beta-turn helix; facilitation; inhibition; Chimeric; polyproline; beta-turn helix; facilitation; tibrosis; retrovirus; envelope glycoprotein; gene therapy; cystic fibrosis; cancer; human immunodeficiency virus; cancer; h

```
Introducing genes into eukaryotic cells using peptide with two preceptor binding regions - especially as part of a viral preceptor binding regions - especially as part of a viral preceptor binding regions - especially as part of a viral preceptor binding regions - especially as part of a viral preceptor binding at a particular cell types prench.

CC aprotein binding a target molecule on the cell surface, and, at the ccl aprotein binding a target molecule on the cell surface and, at the ccl extensions, a second protein recognising a secondary target molecule on the cell surface. The two domains are separated by apeptide comprising the cell surface. The two domains are separated by a peptide comprising consequence is an example of a pro-rich linking peptide. The pro-rich generated acts by facilitating or inhibiting binding between the C-terminal protein and its receptor, and inhibiting binding between the C-terminal protein does not interact with its target. The whole construct especially constituted acts by facilitating or inhibiting binding between the construct especially construct approach of a (retro)viral envelope glycoprotein. The recombinant construct approach of a construct especially for gene therapy, e.g. in construct of a construct especially for gene therapy, e.g. in the construct of the construct especially for gene therapy, e.g. in construct of the construct of the

Introducing genes into eukaryotic cells using peptide with two receptor binding regions - especially as part of a viral glyco-protein, used in gene therapy to ensure precise targeting of precise to particular cell types

PT vectors to particular cell types

S Disclosure; Fig 13; 117pp; French.

CC A novel chimeric protein for gene transfer comprises, at the N-terminus, cc cell surface are comparted for gene transfer comprises, at the N-terminus, cc cell surface. The two domains are separated by a peptide comprising cat least 30% pro residues arranged so as to induce approximately 180 deg. Cc terminus spread to form a polyproline beta-turn helix structure. This sequence is an example of a Pro-rich linking peptide. The pro-rich peptide acts by facilitating or inhibiting binding between the C-terminal protein and its receptor, and inhibition occurs as long as the N-terminal protein does not interact with its target. The whole construct especially forms part of a (retro)viral envelope glycoprotein. The recombinant curleic acid into target cells, especially for gene therapy, e.g. in human immunodeficiency virus) infections, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PT Introducing genes into eukaryotic cells using peptide with two receptor binding regions - especially as part of a viral proceeding yence in gene therapy to ensure precise targeting of plyco-protein, used in gene therapy to ensure precise targeting of process to particular cell types

PT vectors to particular cell types

From thathive production of 1,3-propanediol - by single organism retreatable production of 1,3-propanediol - by single organism retreatable comprising specific genes, and capable of using retreatable sources carbon sources.

Claim 13; Page 81-82; 95pp; English.

This is the 1,3 propanediol oxidoreductase encoded by the dharmous specific gene (see va2015) of Klebstella pneumoniae AFCC 25955.

Cenzyme catalyses the reduction of 3-hydroxypropionaldehyde to 1,3-propanediol (1). A claimed method for production of (1) comprises culturing a microorganism transformed with a cassette containing at least 1 of the genes (see v42012-21) for glycerol-3-phosphate dehydrogenase, glycerol-3-phosphatase, glycerol-3-phosphatase, glycerol-3-phosphatase, and 1,3-propanediol oxidoreductase (see w30676-85). Any of these genes not present on the cassette must be present endogenously. The enzyme sequences may include substitutions, deletions and additions provided activity is not altered. A single recombinant organism can now be used for production of (1) from inexpensive C-sources (contrast use of a starting material for polyesters, polyurethanes and cyclic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             W30679

PT Nucleic acid encoding Fc receptor-like polypeptides or their Nucleic acid encoding Fc receptor-like polypeptides or their provides. PT Nucleic acid encoding Fc receptor transformed cells and antibodies, provided for treating and diagnosing diseases of the haematopoietic provening for treating and diagnosing diseases of the haematopoietic provening for the Fc receptor-like II protein (FCR-II) of the Claim 23; Fig 2A; 141pp; English.

CC This sequence is the Fc receptor-like II protein (FCR-II) of the complex related diseases (e.g. rheumatoid surthritis, systemic lupus complex related diseases (e.g. rheumatoid arthritis, systemic lupus complex related diseases (e.g. rheumatoid arthritis, systemic lupus complex related diseases (e.g. rheumatoid arthritis, systemic lupus complex related of sease (e.g. rheumatoid arthritis, systemic lupus complex related of sease (e.g. rheumatoid arthritis, systemic lupus complex related of inhibitors of viral (e.g. human immune deficiency or immunomodulators and inhibitors of viral (e.g. human immune deficiency or dengue viruses) entry into cells. The proteins may also be used to screen (ab), and for identification of particular cells or raising antibodies (ab), and for identification of particular cells or tissues. The Ab can be used therapeutically as antagonists, for raising antibodies (affinity purification of the proteins. The DNA and its fragments are cuseful as hybridisation (chromosome mapping) and diagnostically to measure (c. g. semmence 163 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               W09831806-A2.

Claim 13; Page 149-150; 325pp; English.
Claim 13; Page 149-150; 325pp; English.
The sequence is that of a suppressor of cytokine signalling protein (SOCS). SOCS can be used to screen for naturally occurring antibodies to SOCS, which may occur, e.g. in some autoimmune diseases. Alternatively, specific antibodies can be used to screen for SOCS, which is useful as a knowledge of SOCS levels may be important for the diagnosis of certain cancers. Soluble SOCS polypeptides can be used to treat disease, injury or abnormality involving cytokine mediated cellular responsiveness, e.g. hyperimmunity, immunosuppression, allergies and hypertension. The sequence is that of a suppressor of cytokine signalling protein (SOCS). SOCS can be used to screen for naturally occurring antibodies to SOCS, which may occur, e.g. in some autoim diseases. Alternatively, specific antibodies can be used to screen for SOCS, which is useful as a knowledge of SOCS levels may be important for the diagnosis of cerem. Sociable SOCS polypeptides can be used to treat disease, injury or abnormality involving cytokine mediated cellular responsiveness, e.g. hyperimmunity, immunosuppression, allergies and hypertension.
                                                                                                                                                                                                                                                                                                                                                                                                                                14-MAY-1998.

Claim 13; Page 158-159; 325pp; English.
The sequence is that of a suppressor of cytokine signalling protein (SOCS). SOCS can be used to screen for naturally occurring antibodies to SOCS, which may occur, e.g. in some autoim diseases. Alternatively, specific antibodies can be used to screen for SOCS, which is useful as a knowledge of SOCS levels may be important for the diagnosis of certain cancers. Soluble sock polypeptides can be used to treat disease, injury or abnormality involving cytokine mediated cellular responsiveness, e.g. hyperimmunity, immunosuppression, allergies and hypertension.

27-0CT-1998 (first entry)
Mus musculus SOCS13 protein.
SOCS; suppressor of cytokine signalling; PCR primer;
autoimmune disease; diagnosis; cancer; treatment;
cytokine mediated cellular responsiveness; hyperimmunity;
immunosuppression; allergies; hypertension.
Mus musculus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Suppressor of cytokine signalling proteins - useful to treat disease, injury or abnormality involving cytokine mediated celluresponsiveness e.g. hyperimmunity, immunosuppression, allergies
                                                                                                                    WPI; 98-286854/25.

SOCS can be used to screen for naturally occurring antibodies to SOCS, which may occur, e.g. in some autoimmune diseases. Alternatively, specific antibodies can be used to screen for SOCS, which is useful as a Knowledge of SOCS levels may be important for the diagnosis of certain cancers. Soluble SCS polypeptides can be used to treat disease, injury or abnormality involving cytokine mediated cellular responsiveness, altergies and hypertension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                _SEQUENCE 1.0

Claim 13; Page 110; 325pp; English
The sequence is that of a suppressor of cytokine signalling
protein (SOC5). SOCS can be used to screen for naturally
protein (SOC5). SOCS can be used to diseases. Alternatively, specific antibodies can be used to
diseases. Alternatively, specific antibodies can be used to
screen for SOCS, which is useful as a knowledge of SOCS lovels
screen for SOCS, which is useful as a knowledge of SOCS lovels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mus musculus SOCS1 protein.
SOCS; suppressor of cytokine signalling; PCR primer;
autoimmune disease; diagnosis; cancer; treatment;
cytokine mediated cellular responsiveness; hyperimmunity;
immunosuppression; allergies; hypertension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            suppressor of cytokine signalling proteins - useful to treat disease, injury or abnormality involving cytokine mediated cell responsiveness e.g. hyperimmunity, immunosuppression, allergies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ŭ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    27-OCT-1998 (first entry)
Mus musculus SOCS3 protein.
SOCS; suppressor of cytokine signalling; PCR primer;
succismmune disease; diagnosis; cancer; treatment;
cytokine mediated cellular responsiveness; hyperimmunity;
immunosuppression; allergies; hypertension.
hypertension

Claim 13: Page 114-115; 325pp; English.

Claim 13: Page 114-115; 325pp; English.

Claim 13: Page 114-115; 325pp; English.

The sequence is that of a suppressor of cytokine signalling

The sequence is that of a suppressor of cytokine signalling

The sequence is that of a suppressor of cytokine signalling

The sequence is that of a suppressor occur, e.g. in some autoims

occurring antibodies to socs, which may occur, e.g. in some autoims

other sequence is some autoims of series of socs levels

screen for SOCS, which is useful as a knowledge of SOCS levels

screen for SOCS, which is useful as a knowledge of SOCS levels

screen for SOCS, which is useful as a knowledge of SOCS levels

screen for SOCS, which is useful as a knowledge of SOCS levels

The sequence is that of a suppressor of cytokine signalling protein (SOCS). SOCS can be used to screen for naturally occurring antibodies to SOCS, which may occur, e.g. in some autoimmune diseases. Alternatively, specific antibodies can be used to screen for SOCS, which is useful as a knowledge of SOCS levels may be important for the diagnosis of certain cancers. Soluble SOCS polypeptides can be used to treat disease, injury or abnormality involving cytokine mediated cellular responsiveness, e.g. hyperimmunity, immunosuppression, allergies and hypertension.
                                                                                                          27-OCT-1998 (first entry)

Transgenic animal growth differentiation factor-11 is inhibited by insertion of transgene, also use of GDF-11 inhibitors for treating muscular wasting, neuromuscular disease, obesity

Reample 3; Page 55-56; 89pp; English.

This 1s the amino acid sequence of human growth differentiation can be used human growth differentiation factor-11 to the newly identified human growth differentiation factor-11 compared to the newly identified human growth differentiation factor-11 sequences protectial N-linked glycosylation signals and putative reveals potential N-linked glycosylation signals and putative reveals potential N-linked glycosylation signals and putative protection is sequences are related not only in the C-terminal region following the putative cleavage site (90% amino acid sequence identity) but also in the pro-region of the molecules (45% amino acid sequence identity. Claimed transgenic animals in which GDF-11 production is reduced produce higher than normal levels of muscle and are useful in the food industry. GDF-11 polypeptides, polynucleotides and antibodies can be used to modulate GDF-11 activity or gene expression for treatment of cell proliferative disorders involving sequence 375 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   W61619

New isolated poly:nucleotide(s) and encoded receptor poly:peptide(s)

- used to develop products for diagnosing or treating e.g. immune

- used to develop products for diagnosing or immuno-compromised disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 11; Page 38-39; 79pp; English.

Clone HTPEF66 is a member of the TM4SF receptor superfamily. The products generated using the receptor can be used for treating abnorm conditions related to both an excess of and insufficient amounts of receptor activity. They can be used in the treatment of e.g. immune disorders, cancers, blood disorders, juvenile rheumatoid arthritis, Graves disease or immunocompromised disease states. The products can sloo be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SEQUENCE 1.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          09-NOV-1998 (first entry)

Its amino acid sequence was deduced from a DNA molecule (see Y4442) isolated from a M. tuberculosis strain Erdman genomic DNA expression library using rabbit antisera raised against M. tuberculosis fractionated proteins. Recombinant RDIF5 was shown to stimulate cell proliferation and interferon gamma production in T cells from M. tuberculosis-immune donors. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see M64291-M64379) comprising antigenic or immunogenic portions of M. tuberculosis antigens, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W64373 Length: 120

Claim 12: Pages 351-352; 483pp: English.

CC This sequence represents a Streptococcus pneumoniae protein of this sequence represents a Streptococcus pneumoniae of the invention. CC Inknown function, and is encoded by a DNA sequence of the invention. CC The DNA sequences were isolated from Streptococcus pneumoniae strain cc 1010993 (NCIMB 40794). The Streptococcus pneumoniae proteins of the cinhibit or activate the activity of the proteins. Antagonists can be used to identify compounds which interact with and cc inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by s. pneumoniae proteins, through genetic used to treat diseases caused by s. pneumoniae proteins or delivery. CC of the encoding nuclei acids in a vector adequate to produce antibody and/or T cell immune responses to protect the animal from disease. The CC capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian CC extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal CC implantation of in-dwelling devices or in wounds. STAT function regulatory protein - used in screening candi substances for cytokine regulatory activity

Claim 2; Pages 39-41; 60pp; Japanese.

The present sequence represents a protein (called SIIS-1, inhibitor of STAT function 1) which regulates STAT protein the JAK/STAT signal transmission system in mammalian cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Stodola RK;
                                                                                                                                                                                                                                                                       A STAT function regulatory protein designated SIIS-1.

SIIS-1, STAT-induced inhibitor; STAT function;

JAK/STAT signal transmission system; STAT3; STAT6; inhibit;

tyrosine phosphorylation; gpi30; cytokine-regulating protein;

screen; cytokine regulatory; inhibitory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           51

TAT protein lian cells

, STAT-induced in function in lanction in lanction in lanction.

candidate

is induced by STAT3 or STAT6. It inhibits tyrosine phosphorylation STAT3 and of gpl30. The SIIS-1 protein sequence contains an SH2 don and is related to the cytokine-regulating protein CIS. SIIS-1, or transformant cells expressing it, may be used to screen candidate substances for cytokine regulatory or inhibitory activity. sequence 212 AA;

The protein is used to generate antibodies and to system for antimicrobials. The products are used to treat or prevent bacterial infections, particularly where caused by S. aureus but also bacterial infections, particularly where caused by S. aureus but also against Helicobacter pylori. Particular applications are to treat subjects before surgery or insertion of an in-dwelling device (alternatively the device itself is impregnated before placement). The nucleic acid sequence is used as sources of antisense sequences (for therapeutic use) or regulatory elements for controlling expression of bacterial genes, and for antibacterial screening. The protein can be also used as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W09833887-A1.

Example 9; Fig 14f; 125pp; English.

Example 9; Fig 14f; 125pp; English.

This is the amino acid sequence of the transforming growth factor.

Generally that appears to relate to various cell; the person of the transforming growth factor.

Deta superfamily that appears to relate to various cell; nerve deta superfamily those appears to relate to various cell; nerve and adipose tissue. The sequence was deduced from a cDNA clone and adipose tissue. The sequence was deduced from a cDNA clone can be sequence with the sequence with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and for poultry reduced cholesterol contents. Method (3) is used to treat muscle wasting or neuromuscular diseases, muscular atrophy and aging, particularly muscular dystrophy, spinal cord or traumatic injuries, congestive or obstructive lung disease, AIDS and cachexia. Method (4) is used to treat cancer of muscle, and connective tissue and bone, or obesity. Also (not claimed) GDF-8 can be used to maintain myoblasts intended for transplanting or to improve efficiency of fusion. Ab can be used to detect and quantify GDF-8 (particularly in muscle, for diagnosis or monitoring), also for immunotherapy and in vivo imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      05-AUG-1998

Stample 9; Fig 14f; 125pp; English.

This is the amino acid sequence of sheep growth differentiation

factor-8 (GDF-8), a novel member of the transforming growth factor-

beta superfamily that appears to relate to various cell

proliferative disorders, especially those involving muscle, nerve

and adipose tissue. The sequence was deduced from a cDNA clone

(see V45823) isolated from a skeletal muscle cDNA library. The

invention provides novel mammalian and avian GDF-8 proteins (see

W69883-92). A transgenic non-human animal is claimed in which

GDF-8 expression is disrupted or interfered with. Also claimed

are: (1) chicken or turkey eggs or meat, beef, milk, pork and lamb

from these animals; (2) method for increasing muscle mass in

animals by administering an antibody (Ab) that binds to GDF-8; (3)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         W69891

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      active fragment. The transgenic animals have increased muscle mass and for poultry reduced cholesterol contents. Method (3) is used to treat muscle wasting or neuromuscular diseases, muscular atrophy and aging, particularly muscular dystrophy, spinal cord or traumatic injuries, congestive or obstructive lung disease. AIDS and cachexia. Method (4) is used to treat cancer of muscle, connective tissue and bone, or obesity. Also (not claimed) GDF-8 can be used to maintain myoblasts intended for transplanting or to improve efficiency of fusion. Ab can be used to detect and quantify GDF-8 (particularly in muscle, for diagnosis or monitoring), also for immunotherapy and in vivo imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      _SEQUENCE 1.

cc inhibiting the action of GDF-8 by treating foetal or adult muscle cc or progenitor cells with a GDF-8 inhibitor; (4) isolated nucleic acid encoding a GDF-8 protein truncated by loss of the C-terminal active fragment. The transgenic animals have increased muscle mass can for poultry reduced cholesterol contents. Method (3) is used to treat muscle wasting or neuromuscular diseases, muscular atrophy and aging, particularly muscular dystrophy, spinal cord or traumatic injuries, congestive or obstructive pinal cord or traumatic injuries, congestive or obstructive pinal cord or connective tissue and bone, or obesity. Also (not claimed) GDF-8 can be used to maintain myoblasts intended for transplanting or to improve efficiency of fusion. Ab can be used to detect and quantify GDF-8 (particularly in muscle, for diagnosis or monitoring), also for immunotherapy and in vivo imaging.
                                                                                                                                                                                                                                                                                                                                                                                          W69892

Example 3; Fig 5a; 115pp; English.

This is the amino acid sequence of mouse growth differentiation factor-8 (GDF-8), a novel member of the transforming growth factor factor-8 (GDF-8), a novel member of the transforming growth factor set a superfamily that appears to relate to various cell proliferative disorders, especially those involving muscle, nerve and adipose tissue. The sequence was deduced from a cDNA clone (see V42113) isolated from a skeletal muscle cDNA library. The invention provides novel mammalian and avian GDF-8 proteins (see W69883-92). A transgenic non-human animal is claimed in which
                                                                                                                                                                                        Transgenic animals with gene for growth differentiation factor-8 disrupted - have increased muscle and reduced cholesterol contenalso use of GDF-8 inhibitors for treating cancer, obesity,

CC are: (1) chicken or turky eggs or meat, beef, milk, pork and lamb CC from these animals; (2) method for increasing muscle mass in animals by administering an antibody (Ab) that binds to GDF-8; (3) cc inhibiting the action of GDF-8 by treating foetal or adult muscle cor progenitor cells with a GDF-8 inhibitor; (4) isolated nucleic active fragment. The transgenic animals have increased muscle mass in condition of GDF-8 protein truncated by loss of the C-terminal correct fragment. The transgenic animals have increased muscle mass correct muscle wasting or neuromuscular diseases, muscular atrophy and aging, particularly muscular dystrophy, spinal cord or traumatic injuries, congestive or obstructive ing disease, AIDS cand cachexia, Method (4) is used to treat cancer of muscle, and connective tissue and bone, or obesity. Also (not claimed) GDF-8 can be used to maintain myoblasts intended for transplanting or to improve efficiency of fusion. Ab can be used to detect and calse of immunotherapy and in vivo imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             !!AA_SEQUENCE 1.0

Human growth differentiation factor-8.
Human growth differentiation factor-8; human; transgenic acrowth differentiation factor-8; muscle; meat; inhibitor; or neuromuscular disease; muscular dystrophy; cachexia; AIDS;
Transgenic animals with gene for growth differentiation factor-8 disrupted - have increased muscle and reduced cholesterol contents, also use of GDF-8 inhibitors for treating cancer, obesity, neuromuscular disease Example 3; Fig 5c: 125pp; English.

This is the amino acid sequence of human growth differentiation factor-8 (GDF-8), a novel member of the transforming growth factor-beta superfamily that appears to relate to various cell proliferative disorders, especially those involving muscle, nerve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              251
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             201

CC and adipose tissue. The sequence was deduced from a CDNA clone CC (see v4580) isolated from a skeletal muscle CDNA library. The CC invention provides movel mammalian and avian GDP-8 proteins (see GC are: (1) chicken or turkey eggs or meat, beef, milk, pork and lamb CC are: (1) chicken or turkey eggs or meat, beef, milk, pork and lamb CC animals by administering an antibody (Ab) that binds to GDP-8; (3) CC inhibiting the action of GDP-8 by treating foetal or adult muscle cor progenitor cells with a GDP-8 by treating foetal or adult muscle caid encoding a GDP-8 protein truncated by loss of the C-terminal cc acid encoding a GDP-8 protein truncated by loss of the C-terminal cc and for poultry reduced cholesterol contents. Method (3) is used to treat muscle wasting or neuromuscular diseases, muscular artrophy CC and adjng, particularly muscular dystrophy, spinal cord or traumatic injuries, congestive or obstructive lung disease, AIDS cand cachexia. Method (4) is used to treat cancer of muscle, and cachexia. Method (4) is used to treat cancer of muscle. Cc can eachexia with a GDP-8 protein truncated by a consective tissue and bone, or obstructive lung disease, AIDS (and cachexia, Method (4) is used to treat cancer of muscle. Cc can be used to maintain myoblasts intended for transplanting or to CC improve efficiency of fusion. Ab can be used to detect and cc calso for immunotherapy and in vivo imaging.
                                                                                   monitoring),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC beta superfamily that appears to relate to various cell
CC proliferative disorders, especially those involving muscle, nerve
CC and adipose tissue. The sequence was deduced from a cDNA clone
CC (see V45817) isolated from a skeletal muscle cDNA library. The
CC invention provides novel mammalian and avian GDF-8 proteins (see
CC GDF-8 expression is disrupted or incerfered with. Also claimed
CC are: (1) chicken or turkey eggs or meat, beef, milk, pork and lamb
CC arimals by administering an antibody (Ab) that binds to GDF-8; (3)
CC inhibiting the action of GDF-8 by treating foretal or adult muscle
CC or progenitor cells with a GDF-8 by treating foretal or adult muscle
CC acid encoding a GDF-8 protein truncated by loss of the C-terminal
CC acid encoding a GDF-8 protein truncated by loss of the C-terminal
CC and for poultry reduced cholesterol contents. Method (3) is used
CC to treat muscle wasting or neuromuscular disease, muscular atrophy
CC and aging particularly muscular dystrophy, spinal cord or
CC tranmatic injuries, congestive or obstructive lung disease, AIDS
CC and cachexia. Method (4) is used to treat cancer of muscle,
CC and cachexia. Method (6) is used to treat cancer of muscle,
CC and cachexia method (7) is used to treat cancer of muscle,
CC and cachexia. Method (7) is used to treat cancer of muscle,
CC and cachexia method (7) is used to treat cancer of muscle,
CC and cachexia of the muscle, for diagnosis or monitoring),
CC also for immunotherapy and in vivo imaging.
CC also for immunotherapy and in vivo imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    W69886

CC factor-8 (GDF-8), a novel member of the transforming growth differentiation CC factor-8 (GDF-8), a novel member of the transforming growth factor-CC beta superfamily that appears to relate to various cell CP proliferative disorders, especially those involving muscle, nerve CR and adjose tissue. The sequence was deduced from a cDNA clone CR (see v45818) isolated from a skeletal muscle cDNA library. The CR invention provides novel mammalian and avian GDF-8 proteins (see CR 65883-92). A transgenic non-human animal is claimed in which CR GDF-8 expression is disrupted or interfered with. Also claimed CR creit (1) chicken or turkey eggs or meat, beef, milk, pork and lamb CR are: (1) chicken or turkey eggs or meat, beef, milk, pork and lamb CR are these animals: (2) method for increasing muscle mass in CR animals by administering an antibody (Ab) that binds to GDF-8; (3) inhibiting the action of GDF-8 by treating foetal or adult muscle call encoding a GDF-8 protein truncated by loss of the C-terminal CR and for poultry reduced cholesterol contents. Method (3) is used to treat muscle wasting or neuromuscular diseases, muscular atrophy CR and aging, particularly muscular dystrophy, spinal cord or traumatic hijuries, congestive or obstructive lung disease, AIDS CR and cachexia. Method (4) is used to treat cancer of muscle. CR can be used to maintain myoblasts intended for transplanting or to cambertive tissue and bone, or obesity. Also (not claimed) GDF-8 CR improve efficiency of fusion. Ab can be used to detect and cachect and duantify GDF-8 (PATKicularly in muscle, for diagnosis or monitoring), sequence 375 AA; Sequence 375 ₽Ą,

Rhodococcus nitrile hydratase gene fragment product.
Rhodococcus; nitrile hydratase gene; expression vector; control factor; nitrilase gene promoter.
Rhodococcus erythropolis.

V65530 ၀

Expression vector - for Rhodococcus genus microbe claim 2; Pages 5-6; 10pp; Japanese.

This represents a product of the nitrile hydratase gene fragment used in the construction of an expression vector for a Rhodococcus genus microbe. The expression vector contains a DNA region encoding a control factor having the ability of activating a nitrilase gene promoter; a DNA region of the nitrilase gene promotor activated by the above control factor; a DNA region producible in the cell of a Rhodococcus genus microbe, and a chemically resistant DNA region functioning in the Rhodococcus genus microbe. An exotic gene can be expressed constitutionally.

The invention provides DNA sequences (V65201 to V65304) from CC protein. The invention provides DNA sequences you follow the Streptococcus pneumoniae genome and corresponding protein sequences (W80605 to W80728). The protein sequences are classified as hypothetical, CC cell wall biosynthetic, external target, or minimal gene set proteins. A CC recombinant host containing a vector comprising any of the above nucleic carids can be used for the recombinant expression of the proteins. The CC acids can be used for the recombinant expression of the proteins. The CC invention also provides a DNA chip having arrayed on it at least 15 base CC invention also provides a DNA chip having arrayed on it at least 15 base CC inventions for evaluating gene expression in S. pneumoniae and for CC identifying virulence genes in S. pneumoniae. Antibodies that selectively bind to the above proteins or peptide fragments can be used to treat CC S. pneumoniae infection. The antibodies can also be used to detect S. pneumoniae cells.

Disclosure; Fig 12; llipp; French.

Disclosure; Fig 12; llipp; French.

The present sequence is encoded by an insert of plasmid pCGE2.18VoNCO represent sequence is encoded by an integrated part of the human to induce apoptosis in cells that have integrated part of the human to induce apoptosis in cells that have integrated part of the human to induce apoptosis in cells that have integrated part of the human to including those expressing wild-type E2) and the corresponding vectors (including those expressing wild-type E2) and the corresponding vectors or truncated E2 (E2TR) are all useful for treating or preventing proteins or truncated E2 (E2TR) are all useful for treating or preventing papillomavirus infection, particularly papillomavirus-associated cancers papillomavirus december of the cervix uteri). The proteins, and sequences expressing them, also induce apoptosis of virus-infected cells and increasing the activity of the p53 tumour repressor.

PT New EPO primary response gene polypeptides and polynucleotides - PT useful as diagnostic reagents and for prevention and treatment of PT useful as diagnostic reagents and for prevention and treatment of PT cancer and autoimmune and inflammatory diseases
PS Claim ; Page 2; 25pp; English.

CC (EPRG1) polypeptide. EPRG1 polypeptides and polynucleotides are useful CC (EPRG1) polypeptide. EPRG1 polypeptides and polynucleotides are useful CC (EPRG1) polypeptides on the EPRG1 not polypeptide or mRNA expression levels can the used to screen for agonists and antagonists CC EPRG1 polypeptide by measuring resulting mRNA levels with CC ELISA. These can be used in treatment to activate (agonist) or inhibit CC (antagonist eg EPRG1 polypeptide by measuring resulting mRNA levels with CC (antagonist eg EPRG1 ligand, receptor or substrate) EPRG1 activity, in CC addition to direct administration of antisense sequences to prevent CC expression, or EPRG1 polypeptides to treat conditions associated with CC a lack of EPRG1 protein. Gene therapy may also be used to affect CC endogenous EPRG1 polypeptide production. EPRG1 antibodies are useful for collecting an immune response to immunise and prevent diseases, and for conduction to inoculate against diseases by inducing an antibody and T-cell CC expression, autoimmune diseases, rheumatoid artivitis and multiple CC expression, autoimmune diseases, including asthma and allergies. The EPRG1 polypeptide is also useful for mapping the gene to a chromosome,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              W82504
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       a lack of EPRG1 protein. Gene therapy may also be used to affect endogenous EPRG1 polypeptide production. EPRG1 antibodies are useful for inducing an immune response to immunise and prevent diseases, and for isolating EPRG1 clones or purifying the polypeptides by affinity chromatography. EPRG1 polypeptides can be administered directly or as a vaccine to inoculate against disease by inducing an antibody and T-cell response. Diseases diagnosed, prevented or treated include anaemia, polycythemia, cancer, neutropenia, AIDS, drug-induced anaemia, diabetes, myelosuppression, autoimmune diseases, rheumatoid arthritis and multiple sclerosis, and inflammatory diseases, including asthma and allergies. The EPRG1 polypeptide is also useful for mapping the gene to a chromosome, allowing gene inheritance to be studied through linkage analysis. The modulate RNA stability and turnover rate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human EPRG1 protein #2.

                              Py Vascular endothelial growth factor-B iso:forms, and DNA encoding provided the provided the provided to inducing anglogenesis and cellular proliferation, provided the provided to inducing anglogenesis and cellular proliferation, provided the present sequence represents human vascular endothelial growth factor the present sequence represents human vascular endothelial growth factor the provided the proliferation of conditional cells and for stimulating anglogenesis (the proliferation of new capillaries form pre-existing blood vessels). These activities are useful for treating tissue growth and repair, including organic repair. This is also useful in pregnancy, in follicle development, as these processes must occur in development of the placenta. The proteins can also be used to raise antibodies, either for use in the proteins of the proteins or as inhibitors of their action. This is capacially useful as angiogenesis is required by tumours as they need consumed to the proteins or as inhibitors of their action. This is sepacially useful as angiogenesis is required by tumours as they need consumed to the proteins or as inhibitors of the proteins or as a subject to grow and proliferate.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated mycobacteria polypeptides and nucleic acids - used for developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis. Claim 1; Page 199; 163pp; English. Mycobacterium tuberculosis protein. The present sequence represents a Mycobacterium tuberculosis protein fragments products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, M. africanum or M. bovis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SEQUENCE 1

Composition containing peptide - can bind to human leucocyte antigen
promposition containing peptide - can bind to human leucocyte antigen
promposition containing peptide - can bind to human leucocyte antigen
promposition containing peptide - can bind to human leucocyte antigen
promposition containing peptides, which can bind to
CC w85284-451 represent helper T-cell class II peptides, which can bind to
CC the human leucocyte antigens (HLA) DRAW4, DRI and DR7. The peptides
CC are used in the course of the invention. The specification describes
CC are used in the course of the invention. The specification describes
CC the treatment or prevention of viral, fungal, bacterial or parasitic
CC infections (e.g. hepatitis, acquired immune deficiency syndrome or
CC malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma, prostate
CC cancer or condyloma acuminatum). Helper T-cell peptides may be used
CC alone to induce a helper T-cell response, e.g. in cases of autoimmune
CC disease, allograft rejection, allergy, Lyme disease, hepatitis,
CC hypersensitivity.

                                                                                                                                                                                                                                                                                                                                                                                      New diagnosis of leukaemia - by detecting genes for tumour antigen rejection precursors or corresponding proteins
Claim 11, Pages 88-69, 88pp; English.
The present sequence represents the amino acid sequence of the SIAX DP2-64 (Oct-T1) gene. The protein is a tumour rejection antigen precursor (TRAP). The specification describes the treatment of disorders which characterised by expression of a leukaemia-associated nucleic acid such as TRH. The products are used for in vivo or in vitro screening for leukaemia, lymphoma or other cancers by usual hybridisation/amplification or immunoassay methods. TRAPs, when molecules, or nucleic acid encoding them, are useful in vaccines for the processed to antigens or complexed with HIA (human lymphocyte antigen) molecules, or nucleic acid encoding them, are useful in vaccines for
                                                                                                      151
                                                                                                                                                        101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 05-NOV-1998.

Host cells transformed or transfected with expression vectors containing nucleic acids encoding the truncated VRP subunits are used to produce the truncated proteins recombinantly. The truncated VRP subunits, and in vitro anglogenic activity and are used to stimulate angiogenesis particularly coronary collateral vessel development in cases of cardiac ischaemia; to disease; to treat ischaemia (e.g. cardiac, chronic coronary or chronic lower limb ischaemia; stroke and peripheral vascular disease); to promote healing of wounds (of skin or intestines), and to increase vascular coronary coular coronary coronar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        201
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       151

PT New truncated vascular endothelial growth factor-related protein PT subunits - lack part of the N-terminal sequence, used to stimulate PT subunits - lack part of the N-terminal sequence, used to stimulate PT angiogenesis, e.g. for treating heart disease and ischaemia Claim 5; Fig 2B; 113pp, English.

CC The invention relates to truncated VRP (vascular endothelial growth CC factor (VEGF)-related protein) subunits that have at least one amino acid CC reminal to the first Cys of the core sequence deleted. Host cells CC truncated or transfected with expression vectors containing nucleic CC truncated proteins recombinantly. The truncated VRP subunits are used to produce the CC expressed from gene therapy vectors, have in vivo and in vitro angiogenic CC collateral vessel development in cases of cardiac ischaemia; to stimulate angiogenesis, particularly coronary CC endothelial cell growth and migration in vitro; to treat heart disease; CC terest ischaemia (e.g. cardiac, chronic coronary or chronic lower limb vounds (of skin or intesthnes), and to increase vascular permeability of Sequences W86234 to W86239 represent full length VRP sequences from Sequence 185 AA;
                                                                                                                                                             W86235

CC That is Fig 2B; 113pp; English.

CC The invention relates to truncated VRP (vascular endothelial growth CC factor (VEGF) related protein) subunits that have at least one amino acid CC transformed or transfected with expression vectors containing nucleic CC cacids encoding the truncated VRP subunits are used to protein cc the cc expressed from gene therapy vectors, have in vivo and in vitro anglogenic CC collateral vessel development in cases of cardiac ischaemia; to stimulate endoughers to treat ischaemia (e.g. cardiac, chronic coronary or chronic lower limb CC ischaemia; stroke and peripheral vascular disease); to promote healing of CC wounds (of skin or intestines), and to increase vascular permeability.

CC sequences W86214 to W86217 represent truncated fragments of VRF-2 (VEGF-CC related factor).

PT New nucleic acid encoding delta5 and other desaturase enzymes - PT useful in production of oils of increased arachidonic acid content, produced, e.g. for treating cancer, as foods, animal feeds and cosmetics Claim 3; Fig 3A-D; 153pp; English.

CC The present sequence represents a Montierella alpina fatty acid delta-5 cd desaturase enzyme. The enzyme sequence is used in the methods of the invention. The specification describes methods for desaturating a cfatty acid and for producing a desaturated fatty acid by expressing compositions and included the enzyme can be used for desaturating fatty acid molecule. The enzyme can be used for desaturated fatty acid so the introduces a double bond carbons 5 and 6 from the carboxyl end of a fatty acid molecule. The enzyme can be used for desaturated fatty acids. The enzyme can be used to produce polyunsaturated fatty acids. The carbox, in cosmetics or in animal feed. The polyunsaturated fatty acids can be used for treating malnutrition, in pharmaceutical compositions, in cosmetics or in animal feed. The polyunsaturated fatty acids can be used for treating e.g. restenosis after angioplasty, concer, diabetes or recame or reduce blood pressure. They can also be used to inhibit compositions are approached any produce polyunsaturated fatty acids or ezema or reduce blood pressure. They can also be used to inhibit compositions of vessel wall smooth muscle and fibrous tissue,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PR WPI; 99-009426/01.

PT New truncated vascular endothelial growth factor-related protein PT subunits - lack part of the N-terminal sequence, used to stimulate PT subunits - lack part of the N-terminal sequence, used to stimulate PT angiogenesis, e.g. for treating heart disease and ischaemia SC laim 5; Fig 2B; 113pp; English.

CC The invention relates to truncated VRP (vascular endothelial growth CC Invention relates to truncated VRP (vascular endothelial growth CC Invention relates to truncated VRP subunits that have at least one amino acid CC N-terminal to the first Cys of the core sequence deleted. Host cells CC cacids encoding the truncated VRP subunits are used to produce the CC truncated proteins recombinantly. The truncated VRP subunits, optionally CC expressed from gene therapy vectors, have in vivo and in vitro angiogenic CC collateral vessel development in cases of cardiac ischaemia; to stimulate angiogenesis, particularly coronary CC collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac ischaemia; to stimulate collateral vessel development in cases of cardiac 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   W86217 Length: 163 February 11,

                                                                                                                                                                                                                                                                                         The present sequence represents a Helicobacter pylori antigenic protein that is characterised by immunoreactivity with H. pylori-positive antisera. The proteins are highly immunogenic and induce a long-lasting immune response that persists even after antimicriobial treatment. In antibody-detection assays, on sera, plasma, wrine, saliva etc., they are highly sensitive and specific. The specification also describes 69 previously unrecognised immunogenic cluster families. H. pylori antigens infection or to confirm eradication of infection, and in vaccines to protect against H. pylori infection and related diseases (gastritis, peptic uncer, gastric adenocarcinoma/lymphoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         analysis.

Claim 1; page 243-244; 402p; English.

The present sequence represents a Helicobacter pylori antigenic protein that is characterised by immunoreactivity with H. pylori-positive antisera. The proteins are highly immunogenic and induce a long-lasting immune response that persists even after antimicriobial treatment. In antibody-detection assays, on sera, plasma, urine, saliva etc., they are highly sensitive and specific. The specification also describes 69 previously unrecognised immunogenic cluster families. H. pylori antigens are used to detect H. pylori-specific antibodies, for diagnosing infection or to confirm eradication of infection, and in vaccines to protect against H. pylori infection and related diseases (gastritis, peptic ulcer, gastric adenoccarcinoma/lymphoma).

New human Wart-11 polypeptide - used to diagnose, treat and prevent PT New human Wart-11 polypeptide - used to diagnose, treat and prevent PT cancer, cardiovascular disease, developmental disorders, stroke and PT neurological disease
PS Claim 17; Page 18-19; 21pp; English.

CC tris polypeptide has at least 95 % sequence identity with the human CC Wart-11 345 amino acid sequence. Host cells are used to produce CC to screen for specific agonists and antagonists (potential therapeutic CC to screen for specific agonists and antagonists (potential therapeutic CC response). Human Wart-11 polypeptide is involved in developmental CC processes and its agonists and antagonists are used for treatment or CC prevention of cancer, cardiovascular disease, stroke, neurological CC disease (e.g. Parkinson's or Alzhahmer's diseases, bipolar/unipolar CC disease (e.g. Parkinson's or Alzhahmer's diseases, bipolar/unipolar CC caromegaly, vitelliform macular dystrophy or vitreoretinopathy.

CC ragments of this polynucleotide sequence can be used for isolating CC related genomic and cDNA clones and for chromosomal or tissue considered consideration (the Wart-11 gene is at chromosome 11q13). The specified CC consesses, or susceptibility to them, are diagnosed by detecting a CC mutation in a genomic whit-11 encoding sequence and/or by analysis for CC presence or amount of Wart-11 (or related mRNA) in a patient sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     W85590
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homo sapiens.

Fragments of this polynucleotide sequence can be used for isolating related genomic and cDNA clones and for chromosomal or tissue localisation (the Wmr-11 gene is at chromosome 11q13). The specified diseases, or susceptibility to them, are diagnosed by detecting a mutation in a genomic wmt-11 encoding sequence and/or by analysis for presence or amount of wmt-11 (or related mRNA) in a patient sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  02-MAR-1999 (first entry)
Polypeptide with 95% homology with human Wnt-11.
Wnt-11; disease; detection; cancer; cardiovascular disease; stroke; parkinsons disease; schizophrenia; alzheimers disease; acromegaly; vitelliform macular dystrophy; vitreoretinopathy; assay; neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              351

pr New isolated human genes and the secreted polypeptides they encode ruseful for diagnosis and treatment of e.g. cancers neurological pr disorders immune diseases, inflammation or blood disorders limbune diseases, inflammation or blood disorders projected proteins (w86534 to w8756). The secreted protein ce encoding human secreted proteins (w86534 to w8756). The secreted protein ce encoding human secreted with the ATCC under deposit numbers ATCC gene sequences are deposited with the ATCC under deposit numbers ATCC (cc 297974, 97975, 97976, 97977, 209007, 209008, 209011). Host (cc 290011, 20908), 209081, 209082, 209083, 209084, 209085, 209511. Host (cc 290011), 209081, 209082, 209083, 209084, 209085, 209511. Caenorhabditis elegans synMuv protein LIN-52. LIN-52; synthetic multivulvar; SynMuv; signal transductio animal model; tumour suppressor; retinoblastoma; cancer; cell proliferation; gene therapy.

signal transduction;

standard; Protein; 161

A

```
New isolated human genes and the secreted polypeptides they encode provided for diagnosis and treatment of e.g. cancers, neurological providers, immune diseases, inflammation or blood disorders for claim 11; page 506-507; 772pp; English.

CC thin invention relates to nucleic acid sequences (V84411 to V8463) cc encoding human secreted proteins (W88534 to W88756). The secreted protein (CC gene sequences are deposited with the ATCC under deposit numbers ATCC cc 209011, 209080, 209081, 209082, 209083, 209084, 209085, 209011. Host cells comprising recombinant vectors containing the nucleic acid sequences are used for the recombinant production of the secreted cc proteins. The polypucleotide and amino acid sequences are useful for are useful for preventing, treating or ameliorating medical conditions e.g. cc sequences are mount of the new polypeptides in a sample or by protein or gene therapy. Pathological conditions can be also diagnosed by determining the amount of the new polypeptides in a sample or by colored this was they are most highly expressed in, and include developing cc specific uses are described for each of the polynucleotides, blood cd disorders, developmental abnormalities and foetal deficiencies, blood cd disorders, developmental abnormalities and foetal deficiencies, blood cd disorders, prostate diseases, lymphomas, inflammation, allergies, cischemic shock, Alzheimer's and cognitive disorders involving osteoclasts such as osteoporosis, archititis or malignancies, diseases of testers, lung or restenosis, prostate diseases, obesity, disorders involving osteoclasts such as osteoporosis, archititis or malignancies, diseases of testers, lung or the present sequence represents human secreted protein (see descriptor cc line for gene number and clone identification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     06.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel LIN-37, -35, -52, -53 and -54 gene from C. elegans of proliferation, e.g. carcinomes of LIN-52, a novel protein of cell proliferation, e.g. carcinomes of LIN-52, a novel protein of Claim 7; Fig 11; 70pp; English.

This is the amino acid sequence of LIN-52, a novel protein of Caenorhabditis elegans. The lin-52 gene (see V72864) is a novel cancer in mammals. The part of a pathway that may be used as a genetic and biochemical model system for tumour suppression and cancer in mammals. SynMuv pathway genes and proteins may be used to identify genes, which are part of the mammalian pathway and to identify genes, proteins and therapeutic compounds which to identify genes, proteins and therapeutic compounds which condulate this pathway. Pure nucleic acids (see V7289-65) encoding C. elegans SynMuv polypeptides selected from LIN-37, -35, -55, -52, C. 3, -54 and E2F-1 (see W3386-92), are new. Also claimed are:

(1) nucleic acids (see V72866-67) encoding the mouse and human homologues of C. elegans LIN-54; (2) vectors containing the nucleic acids; (3) transgenic cells; (4) a pure mammalian SynMuv family polypeptide, and (5) an antibody which binds to a SynMuv family polypeptide, and treat, especially by gene therapy, conditions cancer involving altered levels of cell proliferation, e.g. SynMuv-

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating the Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     31-MAR-1999 (first entry)
H. pylori GHPO 1075 protein.
GHPO protein; Helicobacter infection; gastroduodenal disease; gastritis;
peptic ulcer disease.
Helicobacter pylori.
                                                                                                                                                                                                                                       New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases (claim 8; Page 1616; 2054pp; English.

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating inventions, and gastrointeducted his associated with these infections, and gastrointo, and attophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal diseases. They can also be used for the production of antibodies. The products can also be used for the production of antibodies. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       301
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            201

CC moding human secreted proteins (Y01383 to Y01454). The secreted protein gene sequences are deposited with the ATCC under deposit number ATCC conclusions and sequences are used for the recombinant expression of the secreted proteins. The polynucleotide and amino acid sequences are useful for preventing, treating or ameliorating medical conditions e.g. by concein or gene therapy. Pathological conditions can be also diagnosed by concein or gene therapy. Pathological conditions can be also diagnosed by comparing the amount of the new polynucleotides in a sample or by the comparing and triangents, are useful for chromosome identification and mapping; as antisense and triplex-forming therapeutics; in gene therapy; for forensic) identify related sequences or specific mRNA; in preparation conditions and to raise anti-DNA antibodies. Antibodies are useful as immunoassay reagents (including for in vivo imaging) and therapeutically conditions and to raise anti-DNA antibodies. Antibodies are useful as immunoassay reagents (including for in vivo imaging) and therapeutically conditions and to raise anti-DNA antibodies. A very wide range of confidences and triplex forming in polypeptides. A very wide range of inflammation, cancer or other forms of cell proliferation, viral or other infections. The sequences may also be useful in wound healing, to
                                                                                                                                                                                                                                                                                                                                                                                                                                         N-PSDB; x22268.

New nucleic acids encoding secreted human proteins - potentially secreted human proteins - potentially specific useful for treating and diagnosing diseases and identifying specific

pr Inhibition of virulence genes from Staphylococcus aureus - useful pr for, e.g. screening for potential anti-microbial agents pr for, e.g. screening for potential anti-microbial agents pr for, e.g. screening for potential anti-microbial agents contain 1; Page 179-180; 203pp; English.

CC This is the deduced amino acid sequence of the protein product of a contain 1; Page 179-180; 203pp; English.

CC This is the deduced amino acid sequence of tataphylococcus aureus containing chromosomal insertions containing chromosomal insertions.

CC The nucleotide sequence were identified in a mouse model of bacteraemia. The nucleotide sequence of regions flanking the transposon insertion comparisons were performed to identify these virulence genes (see comparisons were performed to identify these virulence genes (see w97680-724). The plsmy virulence gene product is unknown but comparison and the possible function of their protein products shows 41% identity to the hypothetical 33.7 kpa protein YHCT of Shows 41% identity to the hypothetical 33.7 kpa protein YHCT of ability to interfere with the expression of S. aureus virulence cability to interfere with the expression of S. aureus virulence gene products. Also new is a S. aureus organism containing a gene products. Also new is a S. aureus organism containing a containing and contai

PT New isolated Helicobacter pylori nucleic acids - used to develop PT products for the diagnosis, prevention and treatment of infection by PT products for the diagnosis, prevention and treatment of infection by PT H. pylori and other Helicobacter species
PS Claims 37, 41; Page 224-225; 339pp; English.
CC Recombinant or substantially pure preparations of H. pylori polypeptides CC are disclosed, together with the nucleic acids encoding them. In all, CC cytoplasmic proteins, secreted proteins or other cellular proteins, CC cytoplasmic proteins, secreted proteins or other cellular proteins, CC vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of CC detecting the presence of Helicobacter in a sample. The products are CC detecting the presence of Helicobacter in a sample. The products are CC with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Y11009

Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    08-JUN-1999 (first entry)

Increasing muscle mass in mammals

by decreasing myostatin

L, Poncelet

U

Myostatin; human; transforming growth factor beta; double muscling; muscle hyperplasia; transgenic animal.

Human myostatin. W97887; 07-JUN-1999

(first entry)

Properties of the properties of the transforming growth factor-beta superfamily. The invention of the transforming growth factor-beta superfamily. The invention content to the transforming growth factor-beta superfamily. The invention content to the transforming growth factor-beta superfamily. The invention content to the transforming growth factor-beta superfamily. The invention content to the transforming growth factor-beta superfamily. The invention content to the transforming of the myostatin gene and determining composition of the subvine myostatin gene (see X24415-16) has been detected. Certain content to the transforming myostatin content gene are double-muscled. A new method of increasing muscle mass of a mammal having myostatin content substantially complementary to at least a portion of mRNA concoding myostatin and of sufficient length to reduce myostatin encoding myostatin and of sufficient length to reduce myostatin content also be used. Also claimed are: a method for determining muscular content and the mutation; a diagnostic kit for determining the convine; a method for determining the movine; a method for determining the movine; a method for determining the myostatin generally a method for determining the myostatin penotype of an animal; purified myostatin; isolated nucleic acids; a microbial host cell; a probe based on the myostatin movecout animal content and myostatin penotype of an animal having MH phenotype; and a myostatin knockout animal; content animal content and content animal content and content animal content anim

gene are double-muscled. A new method of increasing muscle mass of a mammal having myostatin expressing muscle cells, comprises administration of a nucleic acid molecule substantially complementary to at least a portion of mRNA encoding myostatin and of sufficient length to reduce myostatin expression and thus increase muscle mass. Also claimed are: a method for determining muscle mass also claimed are: a method for determining the genetype of a sample of genetic material; a method for determining muscling in a mammal; a method for determining of a manimal; purified myostatin; isolated nucleic acids; a microbial host cell; a probe based on the myostatin genetype of an animal; purified myostatin; isolated nucleic acids; a microbial host cell; a probe based on the myostatin gene mustatin; and a transgenic bovine having a gene encoding active myostatin and a heterologous nucleotide sequence antisense to that gene, and optionally further containing a gene encoding a secuence 286 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               W97884). Signor began by English.

Signor between the transforming growth factor beta superfamily. The invention relates to factors affecting muscle development in mammals, including the detection of a mutation in the bovine myostatin gene (see x24415-16). Cattle of the Belgian Blue breed homozygous for the mutant gene are double-muscled. A new method of increasing muscle mass of a mammal having myostatin-expressing muscle cells, comprises administration of a nucleic acid molecule substantially comprises administration of a nucleic acid molecule substantially comprises administration of a nucleic acid molecule substantially comprises administration of a nucleic acid molecule muscle cells, comprises administration of a nucleic acid molecule substantially comprises administration of a nucleic acid molecule muscle mass. Comprises a rabsolution of a nucleic acid molecule substantially comprises and thus increase muscle mass. A ribozyme may also be used. Also claimed are: a method for determining muscular hyperplasia (MH) in a mammal using primers based upstream and downstream of the mutation; a diagnostic kit for determining the genotype of a sample of genetic material; a method for
                                                                                                                                                                                                                                                                                                                                             14-JUI-1998; IB1197.

Artificial synthetic trypsin inhibitor gene (WTI-1b) useful for artificial synthetic trypsin inhibitor gene (WTI-1b) useful for insect resistance in transgenic plants - designed on winged bean chemotrypsin inhibitor (WCI-3) using codon and base comparisons bisclosure; page 15; 21pp; English.

This polypeptide comprises chymotrypsin inhibitor WCI-3 of winged bean (Psophocarpus tetragonolobus (L.) DC.). An artificially synthesised gene (see X24282) is claimed which codes for a trypsin inhibitor (see W9783) designed for stable expression in rice. The trypsin inbihitor comprises the winged bean WTI-1B polypeptide having an N-terminal hydrophilic peptide derived from WCI-3 (i.e. amino acid residues 1-24 of WCI-3) utilised for transporting the protein precursor to a vacuole after translation. The synthetic was obtained by: (i) comparing WTI-1B and WCI-3 amino acid sequences, and obtaining homologous amino acid pairs (one each from WTI-1a and b); and (ii) selecting codons from WCI-3 if the amino acid pair is the same, and from WTI-1B if they are different. High usage codons are selected and sequences which cause mRNA stability are modified (see also X24294-96). Also claimed is a plant containing the artificially synthesised gene. Trangenic plants can be produced that are resistant to pests, sequence 207 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 W97886

PS Claim 31; Page 61-62; 70pp; English.

CC Claim 31; Page 61-62; 70pp; English.

CC Claim 31; Page 61-62; 70pp; English.

CC and the genes (X31851-864) encoding them. Host cells containing vectors comprising the nucleic acid sequences are used for the recombinant CC expression of the proteins. The polypeptides can be used to screen for CC expression of the proteins. The polypeptides can be used to screen for CC entrapy in the proteins and acid sequences are used for treat diseases caused by S. aureus such as thyroiditis, lung abscesses, infective carditis, CC secretory diarrhoea, cerebral abscesses, conjunctivitis, toxic shock Syndrome folliculitis and septic arthritis. Screening for the presence of the polypeptides may be used to diagnose, predict the susceptibility to, CC or stage the progress of these S. aureus diseases and diseases caused by CH elicobacter pylori such as gastric ulcers and gastric adenocarcinoma. There is not much information known about the essential genes expressed by S. aureus during infection but these new polypeptides have been CC by S. aureus during infection but these new polypeptides have been CC addition, these polypeptides can be used to development of antibiotic resistance. The present sequence represents a CC ensures the effectiveness of the compounds in killing S. aureus. In CC ensures the effectiveness of the compounds in killing S. aureus and condition, those polypeptides can be used to effectively diagnose and CC creatiator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Staphylococcus aureus.

pri treating diseases such as infective endocarditis and toxic shock pri treating diseases such as infective endocarditis and toxic shock pri treating diseases such as infective endocarditis and toxic shock pri treating diseases such as infective endocarditis and toxic shock provides new Staphylococcus aureus polypeptides (Y03781-94) and the genes (X31851-864) encoding them. Host cells containing vectors can be invention provides new Staphylococcus are used for the recombinant of the proteins. The polypeptides can be used to screen for ce expression of the proteins. The polypeptides can be used to prevent or treat diseases caused by a natureus such as thyroiditis, lung abscesses, infective carditis, contained to screen for containing the secretory distributis, lung abscesses, infective carditis, contained to syndrome folliculitis and septic arthritis. Screening for the presence of the polypeptides may be used to diseases, infective carditity to, core stage the progress of these S. aureus diseases and diseases caused by G. aureus during infection but these sand gastric adenocarcinoma. CC didntified as essential formation known about the essential genes expressed by S. aureus during infection but these new polypeptides have been contained to development of antibiotic resistance. The present sequence represents a contrained to fantibiotic resistance. The present sequence represents a contrained to a polypeptide which has homology to a B. subtilis probable

PT New isolated human genes and the secreted polypeptides they encode principal for diagnosis and treatment of e.g. cancers, neurological principal disorders, immune diseases, inflammation or blood disorders bisclosure; Page 122; 464pp; English.

PS Disclosure; Page 122; 464pp; English of a secreted human protein encoded CC price in the mucleic acid molecule detailed in the descriptor line. The gene cc can be used to generate fusion proteins by linking to the gene to a human cc immunoglobulin Fc portion (e.g. x27302) for increasing the stability of the fused protein as compared to the human protein only.

CC acid sequences: x27311 x2744; amino acid sequences Y02650 Y02788) which care useful for preventing, treating or ameliorating medical conditions can be ce g. by protein or gene therapy. Also, pathological conditions can be composed by determining the amount of the new polypucieotides. CC or by determining the amount of the new polypucieotides. CC which tissues they are most highly expressed in (see X27311 for described cruses).
                        Y02934 Length: 53
                                                                                                                                                                                                                                                                                       Brewer LA, Eb

PT New polypeptide comprising transcription factor Brn-3a, or its prodefined by the processing nervous system diseases, preventing procellular apoptosis and increasing nervous system diseases, preventing procellular apoptosis and increasing nervous regeneration following procellular apoptosis and increasing nervous regeneration following procession of transcription factor Brn-3a can protect neuronal CC over expression of transcription factor Brn-3a can protect neuronal CC of the BC1-2 gene in neuronal cells and this activates expression CC of the BC1-2 gene. Both the anti-apoptopic effect of Brn-3a and its ability to activate expression of BC1-2 are mediated by the N-terminal CC of the BC1-2 gene. Both the anti-apoptopic effect of Brn-3a and its ability to activate expression of BC1-2 are mediated by the N-terminal coles in the regulation of selective apoptosis during development of the neurons system. The stimulation of Bc1-2 expression by Brn-3a in a neuron specific manner and consequent protection of neuronal cells from apoptosis suggests that Brn-3a my co-ordinate some aspects of neuronal reorganisation during development or following injury. The cleavest of Brn-3a expression by either pharmacological means of comparision of the protection of protection of Brn-3a expression by either pharmacological means.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Y11970

PT New isolated prostate-derived nucleic acids - used to develop products which may have cytokine, immune regulatory, haematopoiesis PT regulating, anti-inflammatory or tumour inhibition activity atti-inflammatory or tumour inhibition activity atti-inflammatory or tumour inhibition activity (CC x40438 to x40715 represent 5' expressed sequence tags (ESTs) for human CC x11716 to Y11993 respectively. The proteins given represent the signal CC peptide and an N-terminal fragment of a secreted protein. The nucleic CC acid sequences can be used for producing secreted human gene products. The proteins obtained may have cytokine activity, cell proliferation and CC differentiation activity, haematopoiesis regulating activity, tissue CC growth regulating activity, reproductive hormore regulating activity, componently and activity, anti-inflammatory activity, tumour inhibition CC activity or other activities. The products can be used in forensic, gene CC therapy and chromosome mapping promoters on be used in forensic, gene CC encoding the signal peptides can be used for obtaining corresponding promoters sequences. The nucleic acids centration of a polypeptide or the insertion of a polypeptide into a cell. Sequence 113 AA;

PT Use of an MHC class II-associated invariant chain protein (CLIP) for PT treating or preventing an immune disorder.

CC Theis sequence represents the human CLIP immunomodulatory peptide.

CC Theinvention relates to a method of treating or preventing an immune contains requested invariant to chain protein (CLIP) to an affected/susceptible mammal. The CLIP peptides are useful as immunogenic compositions for: (1) increasing the level of CLIP cells; (2) decreasing the level of TH1 cells; (3) preventing or cell contain an immune response; (4) reducing or preventing are response to an antigen; (5) reducing or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (5) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen presentation by APCs; and (6) treating or preventing antigen prev
for screening to arrive for ability to arrive for a finite feron-gamma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Singh E

THE REPORT OF THE RESERVE OF THE RES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PT New isolated prostate-derived nucleic acids - used to develop products which may have cytokine, immune regulatory, haematopoiesis pT products which may have cytokine, immune regulatory, haematopoiesis pT regulating, anti-inflammatory or tumour inhibition activity pT regulating, anti-inflammatory or tumour inhibition activity for human cc sucreted proteins expresent 5 expressed sequence tags (ESTs) for human cc secreted proteins expressed in prostate, and encode the proteins given in cc x11716 to y11993 respectively. The proteins given represent the signal critical sequences can be used for producing secreted human gene products. Cc acid sequences can be used for producing secreted human gene products. Cc acid sequence may have cytokine activity, cell proliferation and critical continuity, cell proliferation and critical continuity, cell proliferation and constant activity, nemnotopolesis regulating activity, tissue components of the sequence continuity or other activity, neproductive hormone regulating activity, cc continuity, reproductive hormone regulating activity, and continuity, cc activity, haemostatic and thrombolytic activity, cc activity or other activity. The products can be used in forensic, gene activity or other activities. The products can be used in forensic, gene cc therapy and chromosome mapping procedures. The sequences can also be used consoding the signal peptides can be used for directing extracellular cc secretion of a polypeptide or the insertion of a polypeptide into a ccc membrane, or importing a polypeptide into a cell.
        Human 5' EST secreted protein SEQ ID No: 593.

Human, secreted protein; EST; expressed sequence tag; diagnosis; forensic; gene therapy; chromosome mapping; signal peptide; prostate; upstream regulatory sequence; cytokine activity; cell proliferation; differentiation; haematopolesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition.

New isolated glutathione transferase subunit polynucleotides Claim 3; page 100; 101pp; English.

The present sequence represents ICP and ICV, wheat glutathione transferase (GST) subunits that resemble the type III GSTs of maize. ICP/ICV cDNA (see x25152) was isolated from a cDNA library prepared from fenchlorazole-ethyl (herbicide safener) treated wheat shoots.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       05-701-1999 (first entry)
Wheat Type III glutathione transferase subunit ICP/ICV.
Glutathione transferase; 6507; glutathione peroxidase; wheat;
ICV; herbicide resistance; transgenic plant.
Triticum aestivum.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides wheat GST subunits (see Y05537-45) active in herbicide metabolism. This is fundamental to understanding GST detoxification in wheat and in the development of transgenic herbicide resistant plants expressing wheat GSTs. The invention herbicide resistant plants expressing wheat GSTs. The invention provides methods of identifying compounds capable of metabolism by GST, or compounds that induce GST expression in graminaceous plants, and for determining the GST level in a sample of seed or flour. Transgenic plants, host cells used for production of GST subunits and GST dimeric proteins, and vectors are also provided.

PT New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products PT isolated using sera from cancer patients, used to develop products PT isolated using sera from cancer patients, used to develop products PT isolated using sera from cancer isolated cancers

PT Disclosure; Page 391-392; 787pp; English.

CC The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a cc nucleic acid molecule (NAM). The method comprises: (a) contacting a cc biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression cc interaction between the agent and the NAM or the expression product as a codetermination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Y07007 Length: 177

CR identifying coding or promoi infection-associated protein for infection associated protein for infection asso
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 W93953
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              e.g. leukemia; lymphoma, myeloma, adenocarcinoma, sarcoma, cancer of e.g. bladder, bone, brain, lung, liver, ovary, skin, etc, teratocarcinoma, or to treat or prevent immune responses e.g. allergies, asthma, diabetes, multiple sclerosis, Grave's disease or myasthenia gravis.
         Mycobacterial DNA vectors containing reporter constructs - for identifying coding or promoter sequences involved in infection-associated protein expression claim 32; Fig 42D; 309pp; French.

Claim 32; Fig 42D; 309pp; French.

Sequences Y04742-Y05000 and Y07201-Y07204 represent secreted proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection. Sequence 273 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel human regulatory molecules (HRM) which have cytostatic activity and act as immune modulators, transcription factors or enhancers. The HRMs can be used to stimulate cell proliferation. Antagonists and agonists of the proteins of the invention can be used to treat cancer. The encoding nucleic acids can be used in microarrays to detect polynucleotides (and their expression levels) that encode HRMs in a biological sample. The HRMs and microarrays can be used diagnose, treat or prevent cell proliferation diseases especially cancer, and the province of the content of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mycobacterium species protein sequence 42D. Secreted protein; Mycobacterium; primer; PCR; amplification; hybridisation; detection; vaccine; immunisation; infection.

Gicquel B, Lim EM, Pelic: Mycobacterial DNA vectors containing reporter constructs - for identifying coding or promoter sequences involved in infection-associated protein expression claim 32; Fig 42F; 309pp; French.
Sequences Y04742-Y05000 and Y07201-Y07204 represent secreted proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection. Mycobacterium species protein sequence 42F.                                                                                                                                                                                                                                                                                                                                                                                            New allelic variant of human STAT3 useful in treating autoimmune or inflammatory diseases Claim 2: Page 10-11; 22pp; English.

This sequence represents a fragment of the hepatic allelic isoform of human Signal Transducer and Activator of Transcription (STAT3) intracellular transcription factor (Akira et al., Cell 77, 63-71 (1994)). The invention relates to isolation of allelic variants of the placental harras sequence harmy plays a role in the upregulation of hepatic acute phase proteins, growth arrest of monocytic cells and in the survival of myeloma cells and so may be used to treat or diagnose autoimmune or inflammatory diseases.

PR New Allelic variant of human STAT3 useful in treating autoimmune or prinflammatory diseases

PI sclosure; Page 12-13; 22pp; English.

CC of mouse Signal Transducer and Activator of Transcription (STAT3)

CC of mouse Signal Transducer and Activator of Transcription (STAT3)

CC of nouse Signal Transducer and Activator of Transcription (STAT3)

CC of nouse Signal Transducer and Activator of Transcription (STAT3)

CC of the placental human STAT3 sequence. hSTAT3 plays a role in the placental human STAT3 sequence. hSTAT3 plays a role in the ccells and in the survival of myeloma cells and so may be used to treat CC or diagnose autoimmune or inflammatory diseases.

SQ Sequence 141 AA;
